**DETAILED ACTION**

***Allowable Subject Matter***

1. Claims 1-5, 7-10, 12-16 and 18-21 are allowed.
2. The following is an examiner's statement of reasons for allowance:

A. Claims 1-5 and 7-10 are directed to a computer readable storage medium storing a computer executable print control program, the computer executable print control program executed by an information processing apparatus. Claim 1 identifies the uniquely distinct features of "code for causing said information apparatus to execute a data amount detection step of detecting an amount of data not yet transmitted to said image-forming device in the second spool file;

code for causing said information apparatus to execute a data determination step of determining whether or not the amount of data detected in said data amount detection step is below a predetermined threshold;

code for causing said information apparatus to execute a data transmission step of transmitting to said image-forming device the print data in the second spool file in segments if it is determined in said data determination step that the amount of data is below the threshold, and

code for causing said information apparatus to execute a second data transmission step of transmitting to said image-forming device the print data in the second spool file if it is determined in said data determination step that the amount of data is above the threshold." The closest prior art Nakatsuma '132 and Bain '434

teaches in Fig. 9 and column 12, lines 1-28, The application program 704 starts a print operation on the client computer 702 (102) by using GDI 705. GDI notifies the Windows spooler 707 and virtual print server print monitor 708 of the print start. Upon reception of the print start notice, the virtual print server print monitor 708 requests a print start to the virtual print server service (server) 712 of the server 703 (101) via the virtual print server service (client) 712. GDI 705 requests the printer driver 706 to convert the print data into a printer language. The printer driver 706 converts the print data into a printer language. The print data (graphics data) converted into the printer language is spooled by the Windows spooler 707. The virtual server print monitor 708 receives the print data spooled by the Windows spooler 707 and passes the print data to the virtual print server service (client) 712. The virtual print server service (client) 712 temporarily stores the received print data in the virtual print spooler 801 as a spooling means, in HD 205 shown in FIG. 2. When all the print data is stored in the virtual print spooler 801 in HD 205, the virtual print server service (client) 712 notifies the virtual print server service (server) 712 of the server 703 (101) of the completion of storing the print data and requests a print operation. The virtual print server service uses the same module both for the client and server which can be used in a discriminating way through setting. As described earlier, this module is not necessarily the same for both the client and server, but different modules may be used which are supplied from different FDs as the storage means, either singularly or in combination with other cited references fails to anticipate or render the above underlined limitations obvious (when used with all the claimed limitations).

**B.** Claims 12-16 and 18-21 are directed to a computer readable storage medium storing a computer executable print control program, the computer executable print control program executed by an information processing apparatus. Claim 12 identifies the uniquely distinct features of "a data amount detection step of detecting an amount of data not yet transmitted to said image-forming device in the second spool file;

a data determination step of determining whether or not the amount of data detected in said data amount detection step is below a predetermined threshold;

a data transmission step of transmitting to said image-forming device the print data in the second spool file in segments if it is determined in said data determination step that the amount of data is below the threshold, and

a second data transmission step of transmitting to said image-forming device the print data in the second spool file if it is determined in said data determination step that the amount of data is above the threshold." The closest prior art Nakatsuma '132 and Bain '434 teaches in Fig. 9 and column 12, lines 1-28, The application program 704 starts a print operation on the client computer 702 (102) by using GDI 705. GDI 705 requests the printer driver 706 to convert the print data into a printer language. The printer driver 706 converts the print data into a printer language. The print data (graphics data) converted into the printer language is spooled by the Windows spooler 707. The virtual server print monitor

708 receives the print data spooled by the Windows spooler 707 and passes the print data to the virtual print server service (client) 712. The virtual print server service (client) 712 temporarily stores the received print data in the virtual print spooler 801 as a spooling means, in HD 205 shown in FIG. 2. When all the print data is stored in the virtual print spooler 801 in HD 205, the virtual print server service (client) 712 notifies the virtual print server service (server) 712 of the server 703 (101) of the completion of storing the print data and requests a print operation. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
